the two Adenostoma'

Martinez Dec. 11. 1900.

My dear Mr Lukens

The package of
specimens came after mailing a
letter for you yesterday

It is Adenostoma sparsifolium.

The other species, Adenostoma fasciculatum
is abundant in the Sierra forming extensive
belts like heath just below the yellow
pine, of course you know, often called
"chamiso". Your species is restricted to
to the southern ranges, I first saw it
on the San Jacinto Mts & it has been
reported from the Mts back of San
Diego I would like to see it in flower.
It belongs to the rose family

Ever yours

John Muir
